ARGUMENTS ACCOMPANYING PRE-APPEAL BRIEF REQUEST FOR REVIEW

I. Status of Claims

Claims 16, 21-40, 42-50 and 52-63 are currently pending in the application, with claims 16, 37, 42, 52, and 63 being independent.

In general, the claimed invention is directed toward a touch pad system that uses capacitance to detect the presence of objects. Using the language of independent claim 52, the touch pad includes a conductive touch layer, where the "conductive touch layer has a conductivity selected to create an image of said conductive object that is larger than an area of contact of said conductive object to thereby increase the capacitance of the formed capacitor and facilitate sensing of the capacitance to determine a position of the conductive object." Thus, the touch pad system uses a conductive touch layer to increase capacitance, and thus improve the performance of the touch pad system.

II. Rejections under 35 U.S.C. § 103

In the office action dated Sept 22, 2004, claims 16, 21-23, 25, 27-33, 37-40, 42-50, 52-57 and 60-62 were variously rejected under 35 U.S.C. § 103(a) as being unpatentable over Grabner et al (U.S. Patent No. 4,731,694), in view of Miller et al (U.S. Patent No. 5,374,787).

As to independent claims 16, 37 and 52, the Examiner stated that <u>Grabner</u> disclosed a touch pad system comprising a sensor layer and an insulative layer (citing FIG. 1 items 7, 8 and 24, and column 3 lines 20-22, 31-61 and column 4, lines 26-30.) The Examiner noted that in one special embodiment of the touch pad the insulative layer 24 also comprises a metallized layer as a conductor on an upper flat surface. The Examiner then admitted that <u>Grabner</u> does not disclose the touch layer having a conductivity selected to create an electrical image of a conductive object that is larger than an area of contact of said conductive object contacting said touch layer. However, the Examiner then stated that <u>Miller</u> discloses, in column 8, line 58 to column 9, line 25, a touch layer having a conductivity selected to create an image of a conductive object that is larger than an area of contact of said conductive object, and wherein said sensor layer capacitively detects the image of said conductive object when a user places a conductive object proximate said touch layer. The Examiner then concluded that it would be have been obvious for one of ordinary skill in the art to combine the references.

In a response to this rejection filed December 7, 2005, applicants argued that the Examiner has mischaracterized the <u>Grabner</u> and <u>Miller</u> references. With regard to the touch pad in Grabner, applicants noted that the touch pad disclosed in <u>Grabner</u> is best described a resistive-based touch pad where a change in resistance is used to determine object location. Specifically, a pressure-dependent resistance is coupled to fixed capacity and used as the measuring variable. See the abstract of <u>Grabner</u>. See also column 4, lines 37-63 and FIG. 2 that illustrates an equivalent circuit diagram for the <u>Grabner</u> touch pad and describe it as being based upon a change in resistance due to pressure on the touch pad. Thus, Applicants

argued that nowhere is <u>Grabner</u> described as capacitively detecting an object or "an image of the conductive object" as recited in independent claim 52.

Furthermore, applicants noted that the covering 24 of <u>Grabner</u> is described as metallized on its upper flat side and electrically grounded, with the metallization effective as a shield. See column 4, lines 26-29. Applicants submitted that such a presumably high-conductivity, grounded layer would hinder any sort of effective capacitive detection of an image of a conductive object. Thus, applicants argued that <u>Grabner</u> does not teach capacitive detection, nor could the metallized layer 24 be used to generate an image that is capacitively detected.

Then, with regard to Miller, applicants argued that Miller does not teach a touch layer "having a conductivity selected to create an image of a conductive object that is larger than an area of contact of said conductive object". Instead, Miller specifically teaches an insulative touch layer. See column 8, lines 58-60 and FIG. 1D, where Miller teaches "An insulating layer 24 is disposed over the sense pads 22 on the top surface 16 to insulate a human finger or other object therefrom" (emphasis added). Applicants noted that FIG. 1D clearly shows the insulating layer 24 on top the device. Thus, insulating layer 24 would clearly comprise the "touch layer" of the device. Clearly, any conductive elements described by Miller are in the underlying sensor layers, and would not be touched and thus not be part of any "touch layer".

Thus, applicants argued that <u>Miller</u> clearly teaches an insulative touch layer, and that <u>Miller</u> likewise fails to teach a touch layer having any specified conductivity. Furthermore, applicants argued that it fails to teach the conductivity selected to create an "image larger than an area of contact".

In response to these arguments, the Examiner has issued a final rejection dated April 22, 2005, from which Applicants now make this appeal. In this final rejection, the Examiner first maintained the original rejections based on <u>Grabner</u> and <u>Miller</u>. Then, in

response to Applicants arguments, the Examiner noted that Applicants have argued that Miller discloses an insulative touch layer. See final the final rejection page 12, item 8. The Examiner however, failed to address applicants' arguments with regard to Miller teaching only an insulative touch layer.

Instead, the Examiner then states that <u>Grabner</u> discloses that the insulative layer 24 also comprises a metallized touch layer as a conductor on the upper surface, and then states it would have been obvious that this extra layer shows the three layers of the touch pad with the sensor layer on the bottom, the insulative layer on the top of the sensor layer and the conductive layer on top the insulative layer. The Examiner then states that this order could be advantageous as to have better touch detection. Thus, the Examiner concludes that the "conductive touch layer is taught by <u>Grabner</u>". See page 13, line 3, of the April 22, 2005 final office action.

However, this directly contradicts previous statements by the Examiner. As stated above, the Examiner has repeatedly admitted that <u>Grabner</u> does not disclose the touch layer having a conductivity selected to create an electrical image of a conductive object that is larger than an area of contact of said conductive object contacting said touch layer. See page 3 of the final office action dated April 22, 2005.

III. Arguments

The Examiner has failed to make a prima facie case of obviousness. Specifically, the Examiner has failed to show that either reference teaches a conductive layer having "a conductivity selected to create an image of said conductive object that is larger than an area of contact of said conductive object to thereby increase the capacitance of the formed capacitor and facilitate sensing of the capacitance to determine a position of the conductive object" as is recited in independent claim 52, and similarly recited in other independent claims. Specifically, the Examiner has previously admitted that while <u>Grabner</u> teaches a touch sensor with a conductive layer, it does not teach a conductive layer having a conductivity selected to create an image of said conductive object that is larger than an area of contact of said

conductive object to thereby increase the capacitance of the formed capacitor and facilitate sensing of the capacitance to determine a position of the conductive object. Furthermore, Miller clearly does not teach any sort of conductive touch layer. Instead Miller only teaches an insulative touch layer.

Thus, nether reference teaches a conductive touch layer having a conductivity selected to create an electrical image of a conductive object that is larger than an area of contact of said conductive object contacting said touch layer. Thus, the rejection cannot stand and must be withdrawn.

IV. Conclusion

In view of the foregoing, it is submitted that the Examiner's reliance upon <u>Grabner</u> and/or <u>Miller</u> alone does not support an obviousness rejection of independent Claims 16, 37, 42, 52, and 63. As such, and because claims 21-36, 38, 39, 40, 43-50, and 53-62, depend from one of the independent claims, the above-noted rejections should be withdrawn. Hence, Applicants request that the reviewing panel find that the present application is in condition for allowance.

Respectfully submitted,

INGRASSIA FISHER & LORENZ
